

Laptop Computer

- Energy Saving Trust Recommended
- Powers all Laptop Computer peripherals ON or OFF automatically
- Pays for itself many times over
- Simply PLUG-IN and SWITCH-ON
- Reduces the risk of fire
- Provides high quality surge protection for your whole system
- PC and MAC compatible
- British Standards compliant

Eliminating standby

Eliminating standby in our homes is not always easy. Those little red lights on your Laptop, scanner and printer are needlessly costing you money every hour.

Research suggests that leaving electrical equipment on standby can reduce equipment lifespan by an average of 15% and creates a needless fire risk.

OneClick Technologies have spent several years developing the world's first patented intelligent plug designed to work automatically and boasts a lifespan of at least 15 years.

Tested to British Standards, RoHS compliant and recommended by the Energy Saving Trust, the IntelliPlug's green credentials, integrity and reliability are endorsed by independently qualified technicians.

Say goodbye to standby.

Whilst all of this activity is being deployed by the computer to run as efficiently as possible, peripheral equipment such as the printer, speakers, scanner, and games consoles have very poor power management and are often left switched on when the Laptop is no longer in use or is not in its docking station. The challenge was to identify when the Laptop was actually being used and not to confuse this with the battery drawing power whilst charging, ensuring that peripheral equipment is only switched off when the Laptop is not in use or in standby. This has been achieved by our Patent Pending USB Auto-Device Detect which automatically switches off peripheral equipment when the Laptop is no longer in use.

How Does It Work?

Laptop Computers have complicated power demands. This is due to the internal software which seeks to reduce the amount of power the Laptop uses. When switching the Laptop on, all of the internal components, including the CD/DVD drives are powered. The computer will switch off internal devices once it has established that they are not required. In addition the Laptop Computer is required to power and charge an internal battery. This means that the power demanded by a Laptop can vary immensely.

No more standby – no more wasted power.

To date OneClick have sold almost 1 million products and we estimate that together we've saved approximately 50 million kilograms of Carbon Dioxide emissions.
